                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            σ
                                                                                                                                                       precursor by mitochondrial processing peptidase to generate isoform 1. Cleavage of isoform 1 by mitochondrial protease I subsequently yields isoform 2.

MISCELLANEOUS: Deletion of MGM1 causes the mitochondria to fragment and aggregate, and subsequently to lose their mitochondrial DNA and become respiration deficient. The Mdm1 mutation results in temperature dependent loss of function. SIMILARITY: Belongs to the dynamin family.

CAUTION: Ref.1 sequence differs from that shown due to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FUNCTION: Involved in the maintenance of mitochondrial morphology and plays a role in the inheritance of mitochondria. During mitochondrial fusion, MGM1 coordinates interaction between the inner and outer membranes to promote the formation of the double membrane. Both isoform 1 and isoform 2 are required for full
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SUBUNIT: Associates with the mitochondria outer membrane proteins FZO1 and UGO1 during mitochondrial fusion.
SUBCELLULAR LOCATION: Mitochondrial intermembrane space.

                                                                                                               This invention relates to a novel isolated monoclonal antibody that specifically binds to an epitope of a non-shed extracellular portion of a shed antigen or of human Mucl or Muclé protein. The invention may be useful for the development of compounds with a cytostatic or for gene therapy. The composition and methods are useful in diagnosing, treating or monitoring malignancies, such as breast or ovarian cancer. The present sequence is that of a peptide which was used for raising antibodies to the extracellular, non-shed region of Muclé and which is claimed in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Payne G,

Vater CA;
                                                                                                                                                                                   This invention relates to a novel isolated monoclonal antibody that specifically binds to an epitope of a non-shed extracellular portion of shed antigen or of human Mucl or Mucls protein. The invention may be useful for the development of compounds with a cytostatic or for gene therapy. The composition and methods are useful in diagnosing, treating or monitoring malignancies, such as breast or ovarian cancer. The presequence is that of a Muc epitope of the invention.
                                                                                                                                                                                                                                                                       New antibody to non-shed human Muc1 or Muc16, useful for diagnosing, treating or monitoring.malignancies, such as breast or ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        shed

The invention may be useful for the development of compounds with a cytostatic or for gene therapy. The composition and methods are useful in diagnosing, treating or monitoring malignancies, such as breast or ovarian cancer. The present sequence is that of the human Mucl6 GST fusion protein which was used in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to a novel method of identifying an agent that modulates the activity of a cancer-related gene. Specifically, it refers to a screening assay to identify potential antitumour agents, as well as methods to assess the cancerous state of a cell. The present invention describes antibodies against the expression products of these cancer-related genes that are capable of targeting a cancerous cell in vivo. Furthermore it provides immuno-conjugates containing such antibodies, which can be used to deliver target therapeutics thereto. Accordingly, these compositions that exhibit cytostatic and immunostimulant activities are useful for preventing or treating cancer in humans and in particular the treatment of ovarian cancer. This polypoptide sequence is a protein encoded by a human cancer-linked gene of the invention.
                                                        Polypeptides comprising an immunogenic portion of an ovarian carcinoma protein or its variants, useful for stimulating an immune response in patient and treating ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                   17-JUL-2000; 2000US-00617747.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match
       The invention relates to an isolated O772P polypeptide, which has the structure fully defined in the specification. The composition containing the polypeptides, polynucleotides, fusion proteins, antibodies, T-cells or antigen presenting cells are useful for stimulating an immune response and treating ovarian cancer. Detecting the presence of the polynucleotides and polypeptides is useful for diagnosing cancer. Ovarian carcinoma cDNAs and protein cDNAs were identified using microarray
                                                                                                                                                                                                      Reed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to polypeptides comprising an immunogenic portion of an ovarian carcinoma protein which acts as an immunostimulant and is cytostatic. The polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations and antigen presenting cells that express the polypeptides are useful for stimulating an immune response in a patient and treating ovarian cancer. This sequence represents protein related to the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SXC
                The invention describes nucleic acids (I) and the polypeptides (II) they CC encode. The nucleic acids (I) may be used for preventing, diagnosing and treating diseases related to their aberrant expression i.e. breast CC cancers. For example, (I) and (II) may be used to treat disorders cascoiated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (II) by expressing cC inactive protesins or to supplement the patients own production of (II). (I) and its complementary sequences may also be used as DNA probes in diagnostic cc molementary sequences may also be used as DNA probes in diagnostic cC assays to detect and quantitate the presence of similar nucleic acids in cs. and therefore which patients may be in seed of restorative therapy. The host cell may also be used as antigens in the production of cantibodies against (II) and in assays to identify modulators of (II)'s expression and activity. The anti-(II) antibodies, agonists and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                        Mitcham ,
Reed SG,
                                                                                  This invention relates to polypeptides comprising an immunogenic portion of an ovarian carcinoma protein which acts as an immunostimulant and is cytostatic. The polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations and antigen presenting cells that express the polypeptides are useful for stimulating an immune response in a patient and treating ovarian cancer. This sequence represents protein
                                                                                                                                                                                             Polypeptides comprising an immunogenic portion of protein or its variants, useful for stimulating patient and treating ovarian cancer.
                                                                                                                                                                                                                                                                                                                                   17-JUL-2000; 2000US-00617747.

                                                                                                                                                                                                                                                                             Mitcham Reed SG,
                                                                                                                                                       The invention relates to an isolated 0772P polypeptide, which has the structure fully defined in the specification. The composition containing the polypeptides, polynucleotides, fusion proteins, antibodies, T-cells or antigen presenting cells are useful for stimulating an immune response and treating ovarian cancer. Detecting the presence of the polynucleotides and polypeptides is useful for diagnosing cancer. Ovarian carcinoma cDNAs and protein cDNAs were identified using microarray
                                                                                                                                                                                                                                       New isolated 0772P polypeptides and polynucleotides, useful in gene therapy, particularly for treating or diagnosing cancer, e.g. ovarian

CC cancers. For example, (I) and (II) may be used to treat disorders associated with decreased expression by rectifying mutations or deletions cin a patient's genome that affect the activity of (II) by expressing cc inactive proteins or to supplement the patients own production of (II). Additionally, (I) may be used to produce (II), by inserting (I) into a cc host cell and culturing the cell to express the protein (II). (I) And its ccomplementary sequences may also be used as DNA probes in diagnostic cc assays to detect and quantitate the presence of similar nucleic acids in cc samples, and therefore which patients may be in need of restorative cc therapy. The host cell may also be used as antigens in the production of captression and activity. The anti-(II) antibodies, agonists and cartivity and as cc antiponists may be used to regulate expression and activity and as cc diagnostic agents for detecting the presence of (II) in samples (e.g. by immunoassay). This sequence represents a secreted ovarian carcinoma

                                                                                                                                                                        The invention relates to a CA125 protein comprising: (a) an extracellular comminoterminal domain; (b) an amino terminal extension; (c) a multiple crepeat domain; and (d) a carboxy terminal domain. The extracellular amino terminal domain comprises 5 genomic exons, the amino terminal extension comprises 4 genomic exons, each repeat unit comprises 5 genomic exons and the carboxy terminal domain comprises a transmembrane anchor with a short cytoplasmic domain, and further comprises 9 genomic exons. The gene for cytoplasmic domain, and further comprises 9 genomic exons. The gene for cytoplasmic domain, mucleic acids (including variants, homologues and CC CA125 is located on human chromosome 19q 13.2. Also included are isolated CA125 repeat domains, nucleic acids (including variants, homologues and CC entrol of expressing CA125 antigen in a cell, the amino acid sequences of the CA125 repeat units (or their variants, fragments or sequences of the CA125 repeat units (or their variants, fragments or sequences of ceptope in the receptor-binding domain of CA125 protein, a diagnostic for detecting and monitoring the presence of CA125 antigen (comprising comprising the presence of CA125 antigen (comprising a comprising sites) and an antisense oligonucleotide that inhibits the captes of CA125 antigen levels or at risk of developing a compression of CA125 antigen levels or at risk of developing a compression of CA125 antigen levels or at risk of developing a compression of CA125 antigen levels or at risk of developing a compression of CA125 antigen levels or at risk of developing a compression of CA125 antigen levels or at risk of developing a compression of CA125 antigen levels or at risk of developing a compression of CA125 antigen levels or at risk of developing a compression of CA125 antigen levels or at risk of developing a compression of CA125 antigen levels or at a compression of CA125 ant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to polypeptides comprising an immunogenic portion of an ovarian carcinoma protein which acts as an immunostimulant and is cytostatic. The polypeptides, polynichlacts as an immunostimulant and is proteins, T cell populations and antigen presenting cells that express the polypeptides are useful for stimulating an immune response in a patient and treating ovarian cancer. This sequence represents protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     17-JUL-2000; 2000US-00617747.

                                                                                                                                                                                                                                                                                                                                                                      the polypeptides, polynucleotides, fusion proteins, antibodies, T-cells or antigen presenting cells are useful for stimulating an immune response treating ovarian cancer. Detecting the presence of the polynucleotides and polypeptides is useful for diagnosing cancer. Ovarian carcinoma cDNAs and protein cDNAs were identified using microarray technology. The present sequence represents a human ovarian carcinoma

                                                                                                                                     The invention describes nucleic acids (I) and the polypeptides (II) they commode. The nucleic acids (I) may be used for preventing, diagnosing and CC treating diseases related to their abbarrant expression i.e. breast cancers. For example, (I) and (II) may be used to treat disorders cancers. For example, (I) and (II) may be used to treat disorders consociated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (II) by expressing consociated proteins or to supplement the patients own production of (II). Additionally, (I) may be used to produce (II), by inserting (I) into a complementary sequences may also be used as DNA probes in diagnostic complementary sequences may also be used as DNA probes in diagnostic cassays to detect and quantitate the presence of similar nucleic acids in complex, and therefore which patients may be in need of restorative consplex, and therefore which patients may be in need of restorative contexpy. The host cell may also be used as antigens in the production of contexpy. The host cell may also be used as antigens in the production of contexposition and activity. The anti-(II) antibodies, agonists and contexposition and activity. The anti-(II) antibodies, agonists and contexposition in samples (e.g. by immunoassay). This sequence represents a secreted ovarian carrinoma.
                                                                   Matches
                                                                                                   Query Match
                                                                                                                                   Sequence
                                                                                                                                                                                     immunoassay).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 16; SEQ ID NO 594; 399pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oncogenic nucleic acids useful treatment of breast cancer.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                               Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            seq length: 0
